

Program 1 was pretty difficult all things considered. It was very similar to 1300's last program as that owned a lot of loading and displaying text. While the input files themselves weren't hard to work around, their presence certainly scared me into doing this pretty last minute. Making sure that pointers connect across .cpp files and minor mistakes with `displayText()` and `getText()` made sure that the program was in no way simple. As for my partner, Harrison Simpson, he was very helpful in terms of technical mistakes. I was able to change my focuses since he was able to communicate the problems with the program so well. He may not have wrote as much of the program, but the value he provided was incredible and deserves a good amount of the credit.
